By analyzing wild emmer wheat at the Evolution Canyon microsite, a hot spot of sympatric speciation, we highlighted how disruptive ecological selection drives primary sympatric speciation in situ. Natural selection, overruling the homogenizing effects of gene flow, split the metapopulation of wild emmer wheat into three reproductively isolated populations.

Few wolves live more than 5 years in the wild, but with ideal conditions can reach 15 years of age. Wolf populations are naturally regulated by prey density and territorial disputes among wolves. In many areas, numbers are mainly limited by human-related factors, including illegal killing, control efforts to address livestock depredation and car accidents.

Wild dogs have a variety of roles in the environment. These roles can be beneficial, neutral or harmful, and can change from time to time. Wild dogs are controlled to reduce the impacts on livestock and other animals. Balancing the roles of wild dogs from environmental and production perspectives is an important challenge for land managers.

Sympatric speciation of wild emmer wheat driven by ecology and chromosomal rearrangements. In plants, the mechanism for ecological sympatric speciation (SS) is little known. Here, after ruling out the possibility of secondary contact, we show that wild emmer wheat, at the microclimatically divergent microsite of "Evolution Canyon" (EC), Mt. Carmel, Israel, underwent triple SS.
