Apparatus 1 was the first developed in the 1960s and consists of a shaft with a stirring 40-mesh basket that is rotated continuously in typically 900 mL of media. It is primarily used for testing beads, tablets and capsules that would otherwise float; the basket ensures the dosage form is completely immersed in the media.

made of glass or other inert, transparent material. The vessel is partially immersed in a suitable water at temp.  $37 \pm 0.5^\circ$ .

## Overview of Dissolution Apparatus (USP I and USP II)

**Objectives** The conventional dissolution test, particularly the USP apparatus I and II, remains an important tool in the armory of the pharmaceutical development scientist. For realistic dissolution characterization, sink conditions, where saturation solubility of a drug in the dissolution medium is at least three times more than the drug concentration, are critical.

Overcoming sink limitations in dissolution testing: a ...
