Epidemiology of Poliomyelitis |
NEJM

Abstract. Poliomyelitis has appeared in epidemic form, become endemic on a global scale, and been reduced to near-elimination, all within the span of documented medical history.

Epidemics of the disease appeared in the late 19th century in many European countries and North America, following which polio became a global disease with annual epidemics.

A subgroup analysis among the paralytic polio patients showed that the increased mortality among respiratory polio patients was attributable to respiratory diseases (SMR = 3.57; CI = 1.61–7.96)), cardiovascular diseases (1.68; 1.01–2.78)) and unknown/ill defined causes (5.79; 2.76–12.15). Finally, a high percentage (29%) of this group of polio patients died of polio sequelae (data not shown).

There is a wide range of disease presentations. The vast majority of people who are infected with the poliovirus don't become sick and have mild symptoms only, such as fever, malaise, headache, nausea and vomiting. Others experience severe muscle pain and stiffness in the neck and back. In the rare but most severe cases, paralysis and even death may occur.
