motor, which combines a variable-reluctance motor with a stepper motor design. The primary difference is, in the stepper motor, the number of the rotor's permanent magnets (poles) increases to between 12 and 200 (300 and 1.80 respectively). The more poles, the greater the rotational

stepper motor is an electromechanical device which converts electrical pulses into discrete mechanical movements.

The shaft or spindle of a stepper motor rotates in discrete step increments when electrical command pulses are applied to it in the proper sequence.

The motors rotation has several direct

relationships to the applied input pulses.

Stepper motors are DC motors that move in discrete steps. They have multiple coils that are organized in

groups called "phases". By energizing each phase in sequence, the motor will rotate, one step at a time. With a computer controlled stepping you can achieve very precise positioning and/or speed control.
